## ABSTRACT:

A computer software application includes multiple software components such as graphical control objects. A help editor receives context-sensitive help information associated with the graphical control objects. Using this help information as well as information about the graphical control objects, the help editor creates a header file and a map data structure. A help developer edits the header file and map data structure to produce a configuration of context-sensitive help functions for the computer software application. The help editor generates a source code header file and a source code map data structure according to the user-indicated configuration for integrating context-sensitive help functions into the computer software application.
